iris gestures

iris is controlled using hand gestures. The various gestures are illustrated in this user manual. To successfully perform a gesture, replicate the illustration to the best of your ability and, most importantly, direct your vision towards your hands. You will receive visual feedback if the gesture was received.

iris

your regular eyes are horseshit

iris

Thank you for purchasing **iris** – the contact lens that allows you to share virtual content in the real world. Please read this manual carefully, and in no time you will be creating spectacular images and viewing the creations of others all around you. With **iris**, you now have a window to a new dimension of creativity.

thank you.

iris

iris Installation

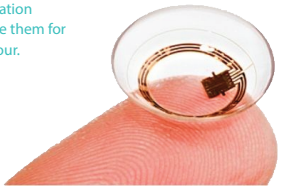
Installing **iris** couldn't be simpler. Place one clean lens on your finger, pull your upper eyelid upward gently, and slowly place the lens on your eye. Blink slowly until the lens has settled comfortably. Repeat for the second lens.

Remove a lens by lightly squeezing it between fingers and pulling it from your eye.

After a few seconds, iris will sense that it has been installed and will automatically power on. Depending on where you are, you may already begin seeing content around you. There is no calibration necessary. You are ready to begin creating!

iris should be cleaned between uses with contact lens solution. Lenses can be worn for multiple days in a row, but, if any irritation occurs, remove them for at least one hour.

iris is powered by your body's movement and heat, so there is no charging required. If you require any troubleshooting, please visit **WMFLabs.com.**



iris 2D drawing

Creating a 2D image is easy. To bring up the workspace, perform Gesture A. The **iris** icon and workspace will appear on a nearby horizontal surface. To move the workspace, press one finger to the iris icon and hold briefly until "pops" off of the surface. Place the workspace in a new position by holding the same finger in the desired location until it pops into place.

A: Open 2D workspace

B: Fill Bucket

C: Eyedropper

D: Pen

E: Color Picker

When you're done with your image, you can either place it into the world or save it into your library. To place it, grab and reposition the iris icon as described above. To save it, perform Gesture A again and the workspace will disappear.

Select tools by performing corresponding Gestures B thru E, shown here. Using the tools is intuitive; just slide your fingers across the workspace.

iris 3D drawing

To create a 3D image, perform Gesture F. Reposition the workspace by moving the iris icon as described above.

Tools are similarly selected as described above using Gestures B thru E, as shown; the additional Model tool (Gesture G) and Make Form tool (Gesture H) are used in 3D mode only.

As with 2D images, you can either place your creation or save it. Move the iris icon to place it, or perform Gesture F to save it into your library.

F: Open 3D Workspace

G: Model

H: Make Form

iris Library

I: Open/Close Library

J: Scroll

K: Delete

To view your library, perform Gesture I . Your creations will be displayed on the nearest horizontal surface. To scroll through the images use Gesture J, keeping your hands still once you have landed on the desire image. To place a creation into the world, grab and move the iris icon as described above.

All of your work is saved automatically over the air to iris servers, so you have a virtually infinite amount of space. However, if you wish to delete a creation, simply perform Gesture K.
